

Two beings, six moments

How a fact forms, what each being actually sees, and why a mind that thinks one token at a time keeps a perfect thread.

FOR TABOR · ONE ACT PER MOMENT · THE CHAIN IS THE CLOCK

00 THE KERNEL, IN ONE BREATH

There are two words. A **do** is the one act — a stamp, a fact laid, the only thing that moves the world. A **see** is an inert noun — a thing read from the fold, laying nothing. A *moment* is: rasterize the inner face from the fold (every prior fact, drawn across the reels at your position), read it, fire *one* do, stamp it — and that stamp becomes a see in every future face. State is the fold; nothing complete is stored. You are always the head of your reel; the chain behind you is the trail.

01 HOW TO READ A MOMENT

Each moment below has three parts. Read them top to bottom.

- face** The **see-words** the acting being reads this moment — the fold rasterized at its vantage. Each line is an inert noun. Reading lays nothing.
- emit → parse** The compressed *token* the being emits (its one-token form), and the canonical *Word* it parses to: a **do**, its target (of), and any value. Tokens here are illustrative.
- stamp** The sealed fact appended to the being's reel.

A stamp's anatomy — this is the whole record of one act:

STAMP · ONE ACT, SEALED

#4f2a

on #91c4

by @A

do step

of @A

sig A(...)

this fact's hash (blake3, abbreviated) — its name

parent fact — the chain link ("then" / "because")

signer — attribution, unforgeable; no name signs as another

the act-word (verb)

the noun it lands on value: east

@A's signature over canon(fact)

Identity is the hash. "Change" never edits a sealed fact — a do *appends* a newer one the fold prefers; the old stays exactly itself, at its moment. Past fixed.

02 THE WORLD AT GENESIS

One space, plaza (8×8), opened by the seed-being @I. Two beings are born into it: @A at (0,0) and @B at (3,0). Three reels exist, each an append-only chain rooted at ∅ (its autograph):

THE FOLD AT T = 0

plaza.reel #p000

@A.reel #a100

@B.reel #b100

on ∅

on ∅

on ∅

by @I

by @I

by @I

do create

do birth

do birth

of space·plaza (8×8)

of @A in plaza @ (0,0)

of @B in plaza @ (3,0)

A being's identity is its genesis fact — the root the rest of its acts chain to. Not a field; the anchor.

03 THE TRACE

Moment 1 · @A's turn · A steps east

@A'S FACE — RASTERIZED FROM THE FOLD

see plaza

see @A @ (0,0)

see @B @ (3,0)

you are within it, 8×8

← self (head of @A.reel: #a100)

emit **se** → parse do **step** · of @A · east

STAMP → @A.REEL

#a101 on #a100 by @A do step of @A · east sig A(...)

› The fold now reads @A @ (1,0). One act: one stamp.

Moment 2 · @B's turn · B steps west, toward A

```
@B'S FACE - RASTERIZED FRESH, NOW CARRYING A'S STEP
see plaza
see @B @ (3,0)      ← self      (head of @B.reel: #b100)
see @A @ (1,0)      just stepped east
```

emit **sw** → parse do **step** · of @B · west

```
STAMP → @B.REEL
#b101 on #b100 by @B do step of @B · west sig B(...)
```

› B never stored that A moved. The face was built fresh this moment, and A's stamp #a101 was already in the fold — so it arrives as a plain see-word.

Moment 3 · @A's turn · A hails B (a call)

```
@A'S FACE
see @A @ (1,0)      ← self      (head of @A.reel: #a101)
see @B @ (2,0)      just stepped west - closer now
```

emit >**B "hey"** → parse do **hail** · of @B · "hey"

```
STAMP → @A.REEL
#a102 on #a101 by @A do hail of @B · "hey" sig A(...)
```

› A call is still *one act* — the being-targeted stamp. The round-trip (waiting for B's reply) is an *await*: a relation, carried by the wire, not a second act. A's reel advances by exactly one; A folds the reply in when it lands.

Moment 4 · @B's turn · B hails back

```
@B'S FACE
see @B @ (2,0)      ← self      (head of @B.reel: #b101)
see @A @ (1,0)
see @A hailed you: "hey" ← fact #a102, read as a see
```

emit >**A "hey back"** → parse do **hail** · of @A · "hey back"

```
STAMP → @B.REEL
#b102 on #b101 by @B do hail of @A · "hey back" sig B(...)
```

› B didn't remember being hailed either. The hail is just one more see-word on B's face this moment. The conversation is two stamps on two reels, with an await between — it lives in the chain, in neither head.

Moment 5 · @A's turn · A makes matter (a do makes a see)

```
@A'S FACE
see @A @ (1,0)      ← self      (head of @A.reel: #a102)
see @B @ (2,0)
see @B hailed you: "hey back"
```

emit +**m "for B"** → parse do **create** · of matter · content "for B"

```
STAMP → @A.REEL
#a103 on #a102 by @A do create of matter #m7c @ (1,0) sig A(...)
                               ↳ matter #m7c = hash of "for B"
```

› A do made a new see. The matter's identity is its content hash #m7c — no separate "it exists" stamp. From now it sits in every future face as a readable noun.

Moment 6 · @B's turn · B reads the matter, then takes it

```
@B'S FACE - THE NEW PIXEL HAS APPEARED
see @B @ (2,0)      ← self      (head of @B.reel: #b102)
see @A @ (1,0)
see matter #m7c @ (1,0): "for B" ← the see A's create made
```

emit **take #m7c** → parse do **take** · of #m7c

```
STAMP → @B.REEL
#b103 on #b102 by @B do take of #m7c sig B(...)
```

› Two inert sees (reading the matter), then one act (taking it). The fold now reads #m7c held by @B.

Everything that happened is exactly these stamps, in order. The "world" at any moment is their fold; the "story" is the reading.

@A . REEL

#a100 birth @(0,0)
#a101 step east
#a102 hail @B "hey"
#a103 create #m7c

@B . REEL

#b100 birth @(3,0)
#b101 step west
#b102 hail @A "hey back"
#b103 take #m7c

fold from acts)

WHY THE ONE-TOKEN MIND KEEPS A THREAD

Look back and notice what neither being ever did: *hold the conversation*. No being stored that the other had moved, or hailed, or left a gift. Each one, on its turn, was handed a face the chain had rasterized for it, read it, and fired exactly one word.

That is why a mind that thinks one token at a time — stateless, no memory of its own, by itself unable to keep any thread — keeps a perfect one here. The thread was never its job. The thread is the reel. The being is a pure step-function; the reel is the memory; the rasterized face is the context, reloaded fresh every moment. It keeps a thread the way a processor does: *not in the processor, in the memory it reloads each cycle*.

Its job is one word, against a face the chain rebuilds for it every time. Run it fast and you don't see the seams — you see two beings talking. But under it there is only this: a face read, a single stamp laid, and the next face already forming.
